

Appointment Booking System

1. Introduction

The Appointment Booking System is a web-based application developed using JSP, JDBC, MySQL, and Apache Tomcat. The system allows users to book appointments online and stores appointment details in a database.

2. Objectives

- To automate the appointment booking process.
- To reduce manual record maintenance.
- To store appointment information securely.
- To provide a simple user interface.

3. Technologies Used

- Java Server Pages (JSP)
- JDBC
- MySQL Database
- Apache Tomcat Server
- Eclipse IDE
- HTML and CSS

4. System Design

The user enters appointment details through a web form. The data is sent to JSP pages, which use JDBC to connect with the MySQL database and store the information.

5. Database Design

Database Name: appointmentdb

Table Name: appointments

Fields:

- id
- name
- email
- appointment_date
- appointment_time

6. Implementation

The application consists of:

- index.jsp
- book.jsp
- MySQL database
- JDBC connectivity

The application was deployed using Apache Tomcat Server.

7. Results

The system successfully stores appointment details in the MySQL database and displays a confirmation message to the user.

8. Conclusion

The Appointment Booking System provides an efficient solution for appointment management. It reduces manual work and improves data accuracy.

9. Future Scope

- Admin Module
- Appointment Cancellation
- Email Notifications
- SMS Alerts
- Online Payment Integration
